Timestamp Language-Independent Type for YAML™

Working Draft 200?-??-??

Oren Ben-Kiki `<oren@ben-kiki.org>`
Clark Evans `<cce+yaml@clarkevans.com>`
Brian Ingerson `<ingy@ttul.org>`

Status

This specification is a release candidate and reflects consensus reached by members of the yaml-core mailing list. Any questions regarding this draft should be raised on this list at http://lists.sourceforge.net/lists/listinfo/yaml-core. With this release of the YAML specification, all further changes will be strictly limited to clarifications, or fixing bugs in productions. At this point, further enhancement or correction of logical flaws will be put off to the next version (1.1) of the YAML specification.

([ \t]*)(Z|[-+][0-9][0-9](:[0-9][0-9])?)? (time zone)
```

Definition: A point in time.

A timestamp value represents a single point in time. This can be serialized using a subset of the ISO8601 format and the formats proposed by the W3C note on datetime [http://www.w3.org/TR/NOTE-datetime]. In addition, a similar format is also supported for enhanced readability, based on white space separation.

If the time zone is omitted, the timestamp is assumed to be specified in UTC. The time part may be omitted altogether, resulting in a date format. In such a case, the time part is assumed to be **00:00:00Z** (start of day, UTC).

Example 1. **!timestamp** Examples

```
